Electric vehicles

24/02/2010

Major design changes are being made to the bonnets of electric vehicles, mainly as a result of fewer design limitations, as they have no combustion engine cooling function. City cars tend to have very short bonnets, with clean-cut designs, and in some cases the front grille actually forms the charging inlet. The fuel is different, but there are really no radical changes in the current design. Additional parts on wheel rims have sometimes been observed for improving the car's aerodynamics on the road, and low rolling resistance tyres tend to be used. New finishes and decors are appearing as a distinguishing feature of electric vehicles. Recyclable materials, paint-free decoration, a lower environmental impact and an "eco" or "natural" look are becoming increasingly popular.
